LS-DYNA 模型建立流程

一、建立幾何形狀:

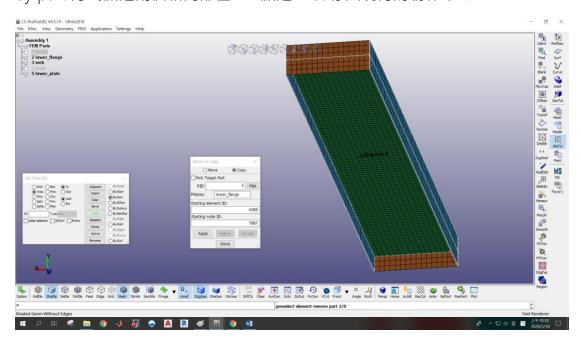

1.Element and Mesh → Shape Mesher (4N Shell) 輸入座標或點選 4 個點形成平面,並依需求決定網格的尺寸,同時輸入物件名稱:

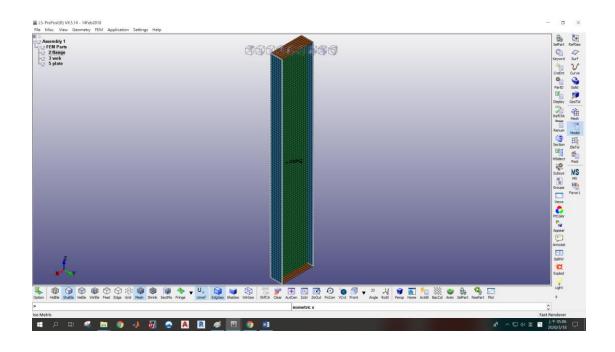

2.建立好初步的外型後, Element Tools → Duplicate Node (Tolerance → Show Dup Nodes → Merge Dup Nodes 依據需求(受力點)合併節點:

3.以複製方式將同樣的部位合併·Element Tools → Move or Copy (Copy) 以by part 方式點選兩個相同部位 → 點選 Plist 存入現有的物件中:

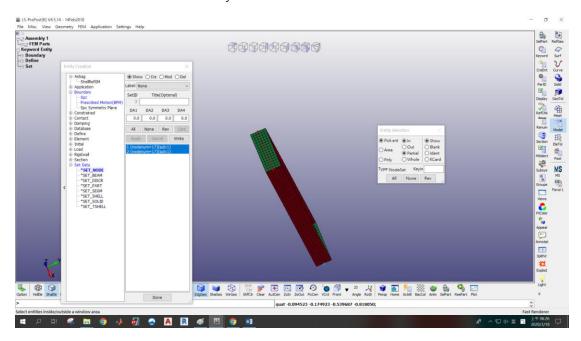

4.左上方取消選取未合併之單一部位,確認後刪除,並更改名稱,外型初步建立完成:

一、增設模型受力節點 :

Model and Part → Creat Entity → Cre 點選受力節點

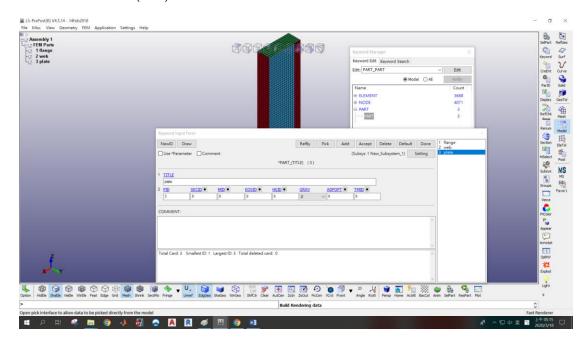

三、設定 KEY 卡 :

Model and Part → Keyword Manager

1.PART:

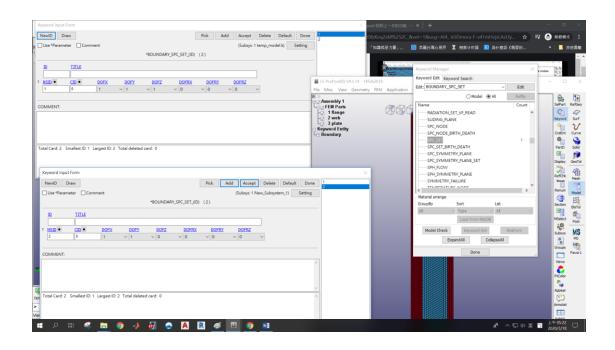

→ PART → PART(PID) 將模型各個部位更改序號:

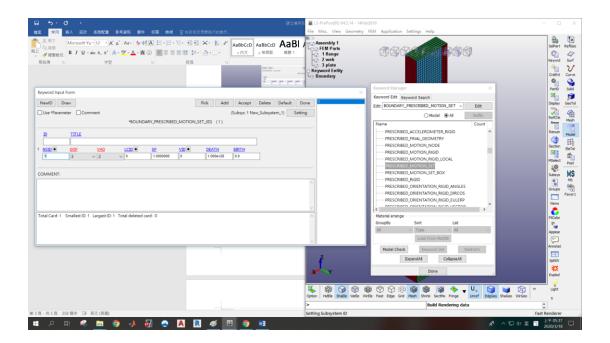

2.BOUNDARY:

- → BOUNDARY → SPC_SET
- \rightarrow BOUNDARY \rightarrow PRESCRIBED_MOTION_SET

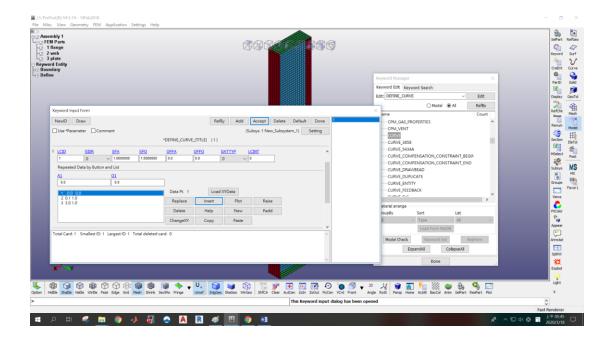

依需求設定邊界條件以及運動控制模式

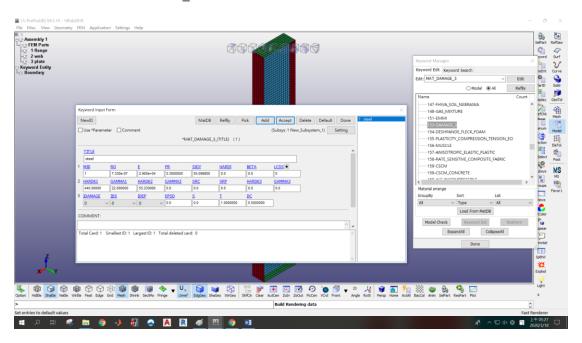

3.DEFINE

→ DEFINE → CURVE 輸入運動函數

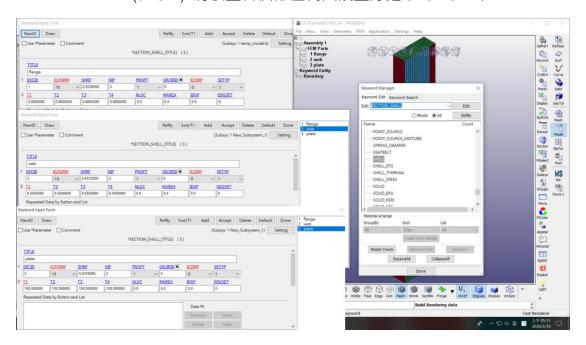

4.MAT:

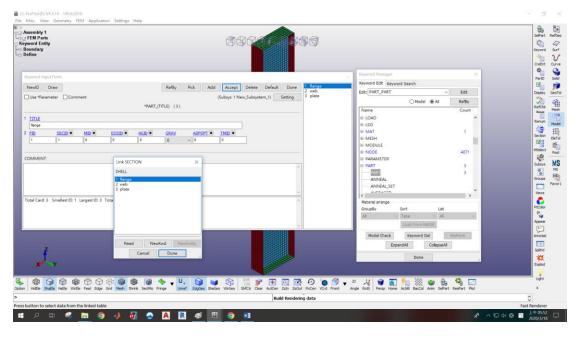

→ MAT →153-DAMAGE 3 依需求設置材料參數

5.SECTION:

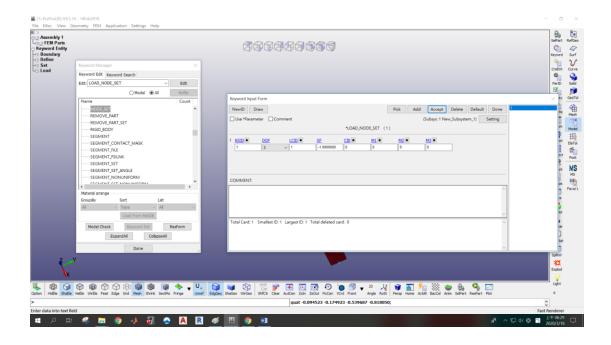

- → SECTION → SHELL 代入各個部位的參數
- → PART → PART(SECID) 將模型各個部位代入設置好之 SECTION 卡

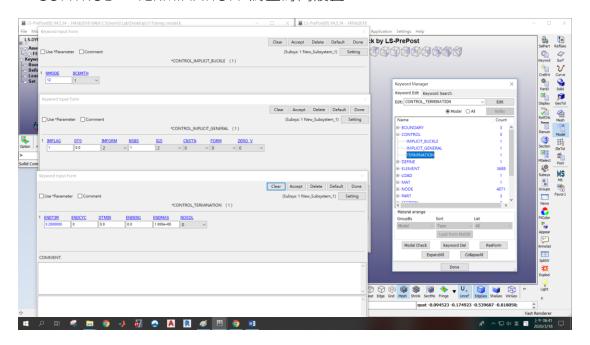

6.Load

→ LOAD → NODE SET 代入施力之節點以及曲線

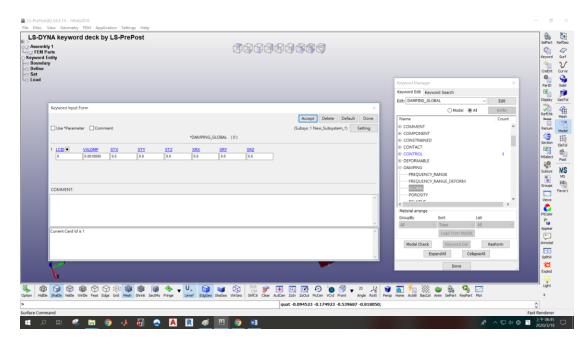

7.CONTROL

- → CONTROL →IMPLICIT_BUCKLE 設置挫屈模式的數量
- → CONTROL → IMPLICIT_GENERAL 顯隱性設置
- → CONTROL → TERMINATION 終止時間設置

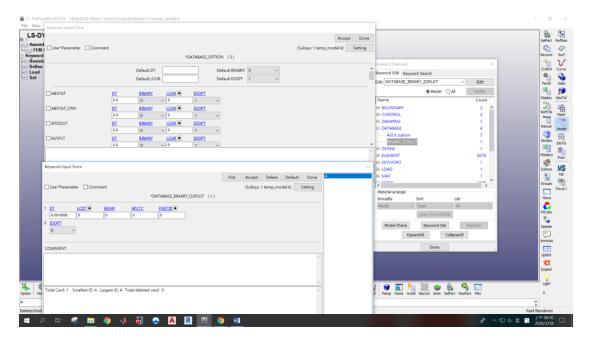

8.DAMPING

→ DAMPINGING → GLOBAL 設置阻尼常數

9.DATABASE

- → DATABASE → ASCII_option 我不知道這做甚麼
- → DATABASE → BINARY_D3PLOT 反正照著輸入

10.其他

- \rightarrow KEYWORD \rightarrow KEYWORD \rightarrow NCPU (0)
- \rightarrow TITLE \rightarrow TITLE (up to you)
